ClamAV

The very basic configuration of ClamAV anti-virus running inside the Docker container. Anti-virus monitors and scans the directory mounted to the following path: `/mnt/DATA`. Communication with update server is performed throught the mandatory VPN connection. The `config.ovpn` for VPN has to be provided and credentials env. variables set.

Setup

Set the environment variables to set on host machine:

```
VPN_USER=""
VPN_PASSWORD=""
```

Install everything by running the install script `Install.sh`.

Customizations

We can modify certain aspects of the system.

Custom events logger

To override the implementation of the default evnts logging script `Scripts/Log.sh` put your implementation under `Custom/Scripts/Log.sh` path. Docker will use that one.
